Abstract:

Logic is the science of forms of right thinking. As we have already mentioned above, logical thinking is a science that beats activity. Its object of verification is contemplation. In order to divide the full of information, we need to find out the process of cognition, the imagination in the Khaki of its invaders. From philosophy we know that this dish is the influence of the human sensory organs of the world on the spinal cord, and as a result of this influence, the dish is to beat and reconcile the things and phenomena of the world. In this article, opinions and comments are made about the importance of logic for the development of society.

Keywords: Logic, emotional cognition, contemplation, form of contemplation, the law of contemplation, correct contemplation, true thought, formal logic, dialectic logic, mathematical logic, Aristotle logic.

The term logic is used in the Arabic word in the meaning of a word, a concept, an idea, a meaning, a connotation. This term is first used when describing the logic found in the science of Tigris, the conical rules and forms of Tigris thinking. The object, which is the source of the second thought process, is used in the expression of relations, connections in the middle of the world's conical rules, as well as the concepts, relations between thoughts, connections, in which the perception is found. We laugh at the two meanings shown above the logical term. From this, the term organizational logic is used in the expression of conceptions that do not have direct relevance to the thinking of nature and the progress of society. For example: the expression "the logic of things", "the logic of vocals" is understood of the nature and the comb of society. These do not necessarily enter into the object of the installation of form, where we are going to shoot. The object of the installation of logical science is contemplation. Sciences, they are both thought-provoking and studying. As is known, the science of psychology examines a person's psychological activity, namely, intuition, perception, consolation, willpower, temperament and other psychological qualities, including the process of thinking.

Psychology emphasizes the process of thinking, the attitude of thought to the head with the other sides of the mind, the development of the body, the effect of his intuition, and vice versa, the effect of intuition on him. The next difference between these two disciplines can be seen in such a way that psychology comes from the empirical, exponential studies of thinking to logic and hits the state. And the logic strikes from the theoretical framework of thinking. Thus, weight loss, on the one hand, differs from psychology with a close relationship with psychology, on the other hand, the examination of the qualities of human thinking by the point of view of different. But at the same time he uses the achievements of the science of logical psychology, based on it.

If psychology has struck certain qualities of thinking, and the church is sharply different from the subject of logic, then the relationship between logic and philosophy is completely different. Knowledge of philosophical science strikes all the invaders of the process as a whole. And the science of logic is one of the conquerors of the process of cognition, striking certain qualities of thinking. Because all his cones, concepts, judgments and conclusions are tied to the main issue of philosophy and come from it. On the second hand philosophy is the theory of its cognition is the attribute of logical science.

The basis of human knowledge is practice, social practice. Does the knowledge of a person come into being in candies? What does a person know about the nature of things and employees? The process of knowing the world of Man consists of two points. First, knowledge of the personality is divided, it consists of intuition, perception and imagination. The dominant form of cognition is intuition. Intuition is something that directly affects our members and reflects some aspects and characteristics of their employees. For example: something and some of the properties found, warmth, reddish color, bitter taste, smoothness. The above form of cognition is distinguished from the perception of consciousness, the difference in the perception of the object, the presence of which affects the perception of our members, the characterization of the object, the holistic state, the main dish features, the reflection. The imagination is the result of our loss of perception of something by someone not in the present, but in the past. For example: bring the image of friends to your autumn front. Imagination but also is the perception of something past time, at the same time the future and the employees. Imagination can be found creative and fantastic. Creative imagination can be found both in oral imagery.

Imagination has elements of generalization of properties in something, separation of some of the main property from secondary properties, such as (differentiation). But having some elements of imagination, he cannot reach the limit of his personality, from the circle of certain things in the knowledge of the object being to the extreme. We learn the connotations of the world, the Moss of things, the generality in them, the connections, and the influence on us with the help of the second Basque thought of cognition. Logical cognition, contemplation in relation to the knowledge of the world and the concepts in it. The main forms of logical cognition are understanding, reasoning and conclusion. Consciousness is a form of thinking, in which the general, necessary, autonomous characters and characteristics in something and employees, the reflection in them, are found. A sentence is an idea in which something is expressed or denied, something in the Tigris of things and their signs, relationships, connections.

The science of great importance in the practical and theoretical activity of man. Knowledge of logic-increases the culture of cognition, helps to think intelligently and consistently, increases the effectiveness and reliability of speech. Knowledge of the basics of logical science has a great importance in acquiring new knowledge, preparing for the lesson, writing essays, reading lectures. Logical knowledge helps us to avoid mistakes in the speech of other people and the logic of their written works in order to avoid them. In order to master it, it is required from the readers, students, and the readers of the orca to master the logic science of the pit, which is based on the theoretical framework, collected over two thousand years more, and the methods and methods of logical thinking and daring, which have arisen.

Proceeding from this general definition of the concept of a cone, we can give both a definition to the concept of a logical cone. The logical connotation is exact, a necessary Barbarian, a repeated connection, a relationship in the middle of thoughts. The most wool in the middle of thoughts and the necessary bonds are represented by the main logical cones-the orb. Following them:

1. Identity canon;

2. Conflict law;
3. Third exception mining;
4. Enough foundation cones.

In conclusion. These cones are therefore the most common logical cones found to have a great deal of logic in them. They stand on the basis of the hammock of their logical forms-the knot of logical thinking ensures its implementation. Identity, conflict and third exception fields have been identified by Aristotle. These fields can be represented using mathematical logical formulas. This Conon cannot be expressed using mathematical logical formulas. Because this cone has a content character. The main logical laws are objects of the world, the perception of certain relations in the human consciousness among the employees. Logical cones have a universal character. People think on the basis of the same aspects, regardless of their nationality, Katy from the profession of the class. Logical cones-object the object is the result of the reflection of something in the world and its relations and properties in the human brain for several thousand years, and it has the character of the object from which it originates.
